The following instructions are for most Windows XP. For other operating systems and some Windows XP machines with some wireless network cards you will need to consult the documentation that came with the computer or card for instructions on how to enter the network name (SSID).

1. Click on the **Start Menu** and choose **Control Panel**.
2. Click on **Network and Internet Connections**.

3. Click on **Network Connections**.
4. Single right-click on the icon for your wireless card. In the drop-down menu, click on **View Available Networks**.

5. In the **Connect to Wireless Network** dialog box, click on **Advanced**.
6. Under **Preferred networks**: click **Add...**

7. Enter **MSBWIRELESS** (Note: all caps, no spaces) for the Network name (SSID). Make sure that encryption (WEP) is **disabled**

    **DO NOT** check "This is a computer-to-computer (ad hoc) network".
8. **MSBWIRELESS** should now appear in the **Preferred networks** box. If any other networks are listed in **Preferred networks**, highlight **MSBWIRELESS** and click **Move Up** Until **MSBWIRELESS** is at the top of the list. Click **OK**.
9. In the Wireless Network Connections Properties dialog box above, click the Advanced button at the bottom (not the Advanced tab at the top).
10. Select **Access point (infrastructure) networks only** in Advanced dialog box.

11. Click Close
12. Click OK
13. If your computer doesn't connect immediately to the network, you may need to reboot for the settings to take effect.
